

## DA-108 PATIO DOOR ROTATOR

The Patio Door Rotator is a solution to the rotation and positioning challenges faced on the patio door production line. The system laterally rotates a patio door to any angle needed.

At the start, the system conveys the patio door into the rotator. Once positioned in the rotator, the Patio Door Rotator will rotate the door as required. With the user friendly HMI, the system can be set to rotate the door to any degree. The operator has the flexibility to patch, clean, or place grid bars on the patio door. After all rotations are complete, the patio door is conveyed out of the rotator.

The Patio Door Rotator can process a maximum door height of 10 feet, a maximum door width of 50 inches, and a minimum door width of 15 inches. The system diagnostics are accessible through the HMI. The machine is designed with a heavy duty welded frame and machine components that are readily available in the USA.
